(54) Title: **PERSONAL CARE COMPOSITIONS AND METHODS-HIGH INTERNAL PHASE WATER-IN-VOLATILE SILICONE OIL SYSTEMS**

(57) Abstract: A composition which is: a) a hair care composition which is a high internal phase water-in-oil emulsion which comprises: (I) an oil phase which further comprises i.) a mixture of non-volatile and volatile silicone oils, and ii.) a silicone surfactant; and (II) which comprises an aqueous phase; and which substantially lacks a fatty alcohol; and b) a skin care composition which is a high internal phase water-in-oil emulsion which comprises: (I) an oil phase which further comprises i.) a mixture of non-volatile and volatile silicone oils, and ii.) a silicone surfactant; and (II) which comprises an aqueous phase.

- 1 -

PERSONAL CARE COMPOSITIONS AND METHODS- HIGH INTERNAL  
PHASE WATER-IN-VOLATILE SILICONE OIL SYSTEMS

5                   BACKGROUND OF THE INVENTION

Typical hair conditioning products are usually based upon a cationic surfactant, generally a quaternary ammonium compound and fatty alcohol. This combination results in an oil-in-water lamellar gel-network that provides the formulation with a thick creamy rheology/viscosity. However, while such traditional compositions deliver conditioning benefits to the hair, the fatty alcohols and quaternary components also deposit onto the hair and continually build-up with each usage, making the hair look and feel weighed down and greasy.

The present invention is directed to a vehicle to deliver beneficial components to the hair and skin. The product forms for hair include leave-on or rinse-off conditioners, shampoos, hair color, and styling aids. The product forms for skin include leave-on or rinse-off skin care products such as lotions and creams.

SUMMARY OF THE INVENTION

20 The present invention is a high internal phase water-in-oil  
emulsion. High internal phase water-in-oil emulsions are  
defined as having greater than about 80% dispersed aqueous  
phase. The internal phase is defined as the non-continuous  
aqueous phase component of the emulsion. When compared to  
25 traditional oil-in-water conditioners, the hair is not weighed  
down as much by compositions of the present invention because  
fatty alcohols are not present in and are not deposited by the  
present hipe w/o formulations. The hipe water-in-oil  
conditioners thus leave the hair with a greater amount of  
30 natural volume, bounce and body. Previous water-in-oil  
emulsion systems known to those in the art of formulating hair

- 3 -

and skin care products typically have dispersed water phases less than 80%. By contrast, the hipe water-in-oil emulsions systems of the present invention tend to deposit less silicone oil on the hair surface leading to improved rinsing and less greasiness and better overall dry hair aesthetics.

The present high internal phase water-in-oil emulsions (hipes) show superior aesthetic properties on skin by releasing the silicone oil more readily when compared to previous lower-internal phase water-in-oil systems (lipes), thereby giving the impression of easier spreading and quicker absorption on the skin surface. Hipes can be utilized for easier application and absorption when compared to lipes.

In the case of skin or hair leave on products, an ideal composition for the delivery of a topically-active compound to the skin or hair would be one that delivers the topically-active agent such that it adheres to the skin or hair while the topically-inactive ingredients evaporate or are removed from the site. Topically delivered active compounds, such as topical medicines or skin care compounds, have conventionally been formulated as either oil-in-water emulsions or water-in-oil emulsions. However, prior topical compositions prepared as these emulsions typically felt wet, sticky and tacky when applied to the skin substrate. Topical effective compositions should preferably possess the properties of smoothness, non-oiliness, and non-tackiness. In addition, the topically effective compositions should not have a wet feel. Therefore, it would be desirable to provide aesthetic benefits for non-greasy, non-sticky, non-wet feeling in topically effective

- 4 -

compositions. The hipes can be utilized with sunscreen or anti-wrinkle agents or reactive agents.

A second disadvantage of typical hair and skin emulsion  
5 compositions is the complex preparation methods. The method  
traditionally requires high processing temperatures, and a  
series of heating or cooling steps. By contrast, the  
present invention, is prepared by a simple process without  
heating or cooling. The invention can also be made clear  
10 through the simple technique of refractive index matching.  
The present invention provides topically effective  
compositions which overcome the above-described difficulties  
and disadvantages of prior hair and skin emulsion  
compositions.

15 The present invention is directed to providing lotion or  
gel-type topically effective compositions, which exhibit  
these consumer acceptable aesthetic properties as well as  
functional properties.

20 The present invention also is suitable for application to  
skin as a lotion, cream or gel and may also contain  
topically active components such as but not limited to  
ultraviolet absorbers (sunscreens) or alpha hydroxy acids.

25 The present invention also addresses improving upon the  
oiliness or greasiness of such products through the use of  
the high internal phase inverse water-in-oil emulsions. For  
example, in U.S. 5,216,033 and EP 435,483 A2, Pereira  
described examples of water-in-silicone skin care lotions.  
30 However, these prior formulations were more difficult to

- 5 -

spread, felt more greasy, had greater residue and were more difficult to absorb into the skin (See Table 5).

5 BRIEF SUMMARY OF THE INVENTION

The invention is directed to a topical composition selected from the group consisting of:

A.) A hair care composition which is a high internal phase  
10 water-in-oil emulsion which comprises:

(I) an oil phase which further comprises

(II) i.) a mixture of non-volatile and volatile  
silicone oils, and ii.) a silicone  
surfactant; and

15 (II) which comprises an aqueous phase;  
and which substantially lacks a fatty  
alcohol; and

B.) A skin care composition which is a high internal phase  
20 water-in-oil emulsion which comprises:

(I) an oil phase which further comprises i.) a  
mixture of non-volatile and volatile silicone  
oils, and ii.) a silicone surfactant; and

(II) which comprises an aqueous phase.

25 More specifically, the present invention is directed to a hair  
care or skin composition which is a high internal phase water-  
in-oil inverse emulsion having improved efficacy, and to  
methods of using the high internal phase emulsion compositions.

30 More particularly, the present invention is directed to a high  
internal phase water-in-silicone oil emulsion comprising a  
continuous external oil phase and an aqueous internal phase.

- 6 -

The continuous oil phase contains a silicone surfactant, and volatile and non-volatile silicone oils. The internal aqueous phase comprises water.

5

The compositions of the present invention comprise a high internal water phase emulsion, with a non-volatile silicone and a volatile, hydrophobic component suitable for application to either hair or skin. In particular, the present invention relates to hair and skin compositions comprising a high internal water phase emulsion which comprises: (1) less than about 20% of a continuous oil phase comprising (a) silicone surfactant or mixtures thereof; (b) a volatile oil and (2) at least about 80% of an aqueous internal phase and methods of treating the hair or skin.

It is the objective of the present invention to provide personal care compositions, having lower levels of oil phase, that offer advantages for both skin and hair care. The advantages for rinse-off hair care products include the ease of rinsing and leaving the hair with more of its natural body. Advantages for leave-on hair products and skin care products include less heaviness, less greasiness, less sticky and less tacky feel and leaving the hands free of residue when compared to typical water-in-oil skin formulations.

By utilizing low levels of silicone surfactant and very volatile dimethicones, the formulations of the invention have

30

- 7 -

been able to overcome the difficulty of rinsing out the formulation from the hair.

High internal phase emulsions (HIPEs or hipes) may also be  
5 utilized in styling type leave-in products alone or in  
combination with polymers (DMAEMA, etc.) or structuring  
compounds (cellulosics, polysaccharides), etc. in order to  
provide control and hair manageability with a very clean,  
natural feel (nonsticky).

10

High internal phase emulsions (HIPES) may also be utilized in  
various shampoos, curling (straightening) or oxidative products  
along with the appropriate surfactants or reactive agents,  
respectively without resoiling and debodifying effects of fatty  
15 alcohol compounds. High internal phase emulsions (HIPES) may  
also be utilized in skin care products such as lotions, wrinkle  
cream and sunscreens. The preparation and use of such products  
would be by methods materials known in the art or analogous to  
those known methods and materials.

20

An idea behind using a HIPE as an Extra Body Conditioner is  
that very little material is left behind on the hair to weigh  
it down after rinsing. By using a low level of silicone  
surfactant in combination with a dimethicone having a boiling  
25 point about that of room temperature (0.65cts) and a  
dimethicone of slightly higher viscosity for conditioning, the  
compositions of the invention rely as much on evaporation as  
rinsing for removal from the hair after conditioning.

30 The invention also comprises a method of treating hair which  
comprises contacting said hair with a composition of the

- 8 -

invention. The invention also comprises a method of treating skin or the underarm which comprises contacting the skin or underarm with a composition of the invention.

5

#### DETAILED DESCRIPTION OF THE INVENTION

As used herein % means weight % unless otherwise noted. When it is said herein that a composition substantially lacks fatty alcohol, this means that said composition has less than about 1% fatty alcohol. Compositions of the invention may be made with known starting materials or with starting materials that can be made by known methods. Compositions of the invention can be made by known methods or by methods which are analogous to known methods.

High internal phase water-in-oil emulsions (hipes) may be utilized in styling type leave-in products alone or in combination with polymers or structuring compounds in order to provide control and hair manageability with a very clean, natural, nonsticky feel. High internal phase water-in-oil emulsions (hipes) may also be utilized in various shampoos, conditioners, styling, curling, waving, straightening, coloring, or oxidative products along with the appropriate surfactants or reactive agents, respectively without the resoiling and debodifying effects of fatty alcohol compounds and without waxy feel upon the hair.

The internal or aqueous phase can comprise from about 80% to about 95% of the composition, or more preferably from about 85% to 90%. The invention also comprises a method of

- 9 -

treating hair which comprises contacting said hair with a composition of the invention.

As noted above in the present invention, the compositions  
5 have both high viscosity and opacity through the use of a high internal phase water-in-oil emulsion. These compositions deliver conditioning agents onto the hair.

Another aspect of the invention is to provide a method of  
10 treating the hair to yield well-conditioned hair having esthetically pleasing physical properties by contacting the hair with an opaque conditioner of the present invention. Another aspect of the invention is to provide a conditioning composition that is easy to rinse from the hair. The  
15 compositions of the invention are easy to rinse from the hair due to the presence of either volatile silicones, polymers, surfactants or other compounds which may alter the deposition upon the hair.

20 The invention is directed to a topical composition selected from the group consisting of:

A.) A hair care composition which is a high internal phase water-in-oil emulsion which comprises:

- 25 (I) an oil phase which further comprises i.) a mixture of non-volatile and volatile silicone oils, and ii.) a silicone surfactant; and  
(II) an aqueous phase; and which substantially lacks a fatty alcohol; and

30 B.) A skin care composition which is a high internal phase water-in-oil emulsion which comprises:

- 10 -

- (I) an oil phase which further comprises i.) a mixture of non-volatile and volatile silicone oils, and ii.) a silicone surfactant; and  
(II) an aqueous phase.

5

Ingredients that are used in the preparation of compositions of the invention are now described.

10 Silicone Surfactants

Exemplary of the silicone surfactants or emulsifiers that are used in compositions of the invention is a dimethicone, which is a dimethylsiloxane polymer having polyoxyethylene and/or polyoxypropylene side chains, such as DOW CORNING 15 3225C and 5225C FORMULATION AID, available from Dow Corning Co., Midland, MI, SILICONE SF-1528, available from General Electric, Waterford, NY, ABIL EM 97, available from Goldschmidt Chemical Corporation, Hopewell, VA and SILWET™ 20 series, available from OSI Specialties, Inc., Danbury, CT. The dimethicone copolyol has about 15 or fewer ethylene oxide and/or propylene oxide monomer units, in total, in the side chains. Dimethicone copolyols conventionally are used in conjunction with silicones because the oil-soluble, 25 silicon-based surfactants are extremely soluble in a volatile or a nonvolatile silicone compound, are extremely insoluble in water. These products have the following general formula:

30

- 11 -

where PE=  $-\text{CH}_2\text{CH}_2\text{CH}_2\text{O}(\text{EO})_m(\text{PO})_n\text{Z}$

In this formula, Me represents methyl, EO represents  
5 ethyleneoxy, PO represents 1,2-propyleneoxy, x and y are 1  
or greater, m and n can be 0 or greater, however the  
molecular weight of the PE unit must be greater than 1000,  
and Z can be either hydrogen or a lower alkyl radical.

10 Suitable silicone surfactants for use in compositions of the  
invention are disclosed in U.S. Patent No. 4,122,029 to Gee.

Another exemplary, but nonlimiting, oil-soluble, silicon-  
15 based surfactant is an alkyl dimethicone copolyol, such as  
cetyl dimethicone copolyol available commercially as ABIL EM  
90 from Goldschmidt Chemical Corporation, Hopewell, VA. The  
alkyl dimethicone copolyols have the structure:

- 12 -

5            wherein p is a numeral from 7 through 17;

          q is a numeral from 1 through 100;

          m is a numeral from 1 through 40;

          n is a numeral from 0 through 200; and

          PE is  $(\text{C}_2\text{H}_4\text{O})_a(\text{C}_3\text{H}_6\text{O})_b\text{-H}$  having a molecular weight of about  
 10 250 to about 2000, wherein a and b are selected such that  
 the weight ratio of  $\text{C}_2\text{H}_4\text{O}/\text{C}_3\text{H}_6\text{O}$  is from 100/0 to 20/80.

15            Volatile Silicone Oils which are included in compositions of  
the invention

          The silicone oil phase of the compositions of the invention  
 comprises a mixture of a volatile silicone oil, and a  
 nonvolatile silicone oil. Exemplary volatile silicone  
 20 compounds include, but are not limited to, volatile, low  
 molecular weight polydimethylsiloxane compounds. They can  
 be either a linear or a cyclic polydimethylsiloxane compound

- 13 -

having a viscosity from about 0.5 to about 10 cst (centistokes). The preferred linear polydimethylsiloxane compounds can have a viscosity range from about 0.5 to 10cst. The preferred volatile polydimethylsiloxanes have a  
5 viscosity in the range of about 0.5 to about 6 cst.

The cyclic, volatile, low molecular weight polydimethylsiloxanes, designated in the CTFA Dictionary as cyclomethicones, are the preferred siloxanes used in a  
10 composition of the present invention. The cyclic volatile siloxanes can be either D4, D5 or D6, and mixtures thereof); boil at atmosphere pressure at from about 35 °C to about 250 °C. The polydimethyl cyclosiloxanes having an average of about 4 to about 5 repeating units per molecule are  
15 especially preferred. Suitable cyclomethicones are available commercially under the trade names DOW CORNING 244 Fluid, DOW CORNING 245 Fluid, DOW CORNING 344 Fluid and DOW CORNING 345 Fluid from DOW CORNING Corporation, Midland, MI., and SILICONE SF-1173 and SILICONE SF-1202 from General  
20 Electric, Waterford, NY.

An example of a linear, low molecular weight, volatile polydimethylsiloxane compound is designated in the CTFA Dictionary as decamethyltetrasiloxane, available  
25 commercially under the trade names DOW CORNING 200 Fluid having a viscosity of 1.5 cst and a boiling point of 195 °C. Other linear polydimethylsiloxanes include octamethyltrisiloxane, and decamethylpentasiloxane which also be useful in the composition of the present invention.

30

- 14 -

Volatile Hydrocarbon Oils which are optional but which may be included in compositions of the invention

The volatile hydrocarbon oil phase comprises about 6 to 20 carbon atoms. A preferred volatile hydrocarbon compound is an aliphatic hydrocarbon having about 8 to 16 carbon atoms, and having a boiling point of about 100 to 250 °C. Exemplary volatile hydrocarbon compound include, isododecane and isohexadecane, i.e., PERMETHYL 99A, PERMETHYL 101A, available from Presperse, Inc., South Plainfield, NJ. Other examples are depicted in general structure formula (I), wherein n ranges from 2 to 3.

Another exemplary volatile hydrocarbon compound is ISOPAR M (a C<sub>12</sub> - C<sub>14</sub> isoparaffin available From EXXON Chemical Co., Baytown, TX).

Non-volatile Silicone compounds which are included in compositions of the invention

Exemplary nonvolatile silicone compounds include a polydimethylsiloxane, polyalkyl siloxane, a polyaryl siloxane or a polyalkylaryl siloxane. The nonvolatile silicones are nonfunctional siloxanes or siloxane mixtures having a viscosity of about 10 to about 10,000cst, and most preferred viscosity about 10 to 500cst at 25°C. A

- 15 -

nonvolatile silicone compound is described as having a boiling point at atmospheric pressure of greater than about 250°C. A phenyltrimethicone also is useful as a nonvolatile silicone compound. An example includes DC 556 fluid, which is available from Dow Corning.

Non-volatile hydrocarbon compounds which may or may not be included in compositions of the invention

The nonvolatile oil phase also can comprise a nonvolatile hydrocarbon compound, such as mineral oil, or isoeicosane. Other exemplary compounds include a water insoluble emollient, such as, for example, an ester having at least about 10 carbon atoms, and preferably about 10 to about 32 carbon atoms. Suitable esters include but are not limited to, for example, aliphatic monohydric alcohol esters including isopropyl myristate and aliphatic di- or tri-esters of polycarboxylic acids including dioctyl adipate.

20

Examples of optional compounds which can be included in compositions of the invention

Exemplary classes of such compounds includes di-long chain alkyl amines (i.e. C<sub>10</sub> to C<sub>22</sub>), long chain fatty amine (i.e. C<sub>10</sub> to C<sub>22</sub>), long chain fatty alcohols (i.e. C<sub>10</sub> to C<sub>22</sub>), ethoxylated fatty alcohols, and double-tailed phospholipids. Specific compounds capable of participating in the formation of a lamellar dispersed phase, include dipalmitylamine, stearamidopropyldimethylamine, cetyl alcohol, stearyl alcohol, steareth-2, steareth-21, phosphatidylserine, phosphatidylcholine, and mixtures thereof.

- 16 -

Optional cationic surfactants may be used so long as they are miscible in the compositions of the invention. The optional cationic surfactants can have the structure:

5

wherein R<sub>1</sub> is an alkyl group including from about 8 to about 20 carbon atoms; R<sub>2</sub> is selected from the group consisting of an alkyl group including from about 8 to about 20 carbon atoms, a hydrogen atom, a methyl group, an ethyl group, a hydroxymethyl group and a hydroxyethyl group; R<sub>3</sub> is selected from the group consisting of a benzyl group, a hydrogen group, a methyl group, an ethyl group, a hydroxymethyl group and a hydroxyethyl group; R<sub>4</sub> is selected from the group consisting of a hydrogen atom, a methyl group, an ethyl group, a hydroxymethyl group and a hydroxyethyl group; and X is an anion. The quaternary nitrogen of the water-soluble quaternary ammonium compound also can be a component of a heterocyclic nitrogen-containing moiety, such as morpholine or pyridine. The anion of the quaternary ammonium compound can be any common anion, such as chloride, methosulfate, ethosulfate, nitrate, bromide, tosylate, acetate, or phosphate, and mixtures thereof.

30

The optional water-soluble quaternary ammonium compounds have one or two long chain alkyl groups containing from about 8 to about 18 carbon atoms. The long chain alkyl groups also can include, in addition to, or in replacement

- 17 -

of, carbon and hydrogen atoms, ether linkages or similar water-solubilizing linkages. The remaining two or three substitutes of the quaternary nitrogen of the quaternary ammonium compound can be hydrogen; benzyl; or short chain  
5 alkyl or hydroxyalkyl groups, such as methyl, ethyl, hydroxymethyl or hydroxyethyl groups; or combinations thereof, either of the same or different identity.

Exemplary water-soluble quaternary ammonium compounds  
10 include, but are not limited to, lauryltrimonium chloride; Quaternium-16; laurylalkonium chloride; olealkonium chloride; dilauryldimonium chloride; cetalkonium chloride; dicetyldimonium chloride; laurylpyridinium chloride; cetylpyridinium chloride; soyatrimonium chloride;  
15 Polyquaternium-6; Polyquaternium-7; guarhydroxypropyltrimonium chloride; polyquaternium-11; polyquaternium-5; polyquaternium-10; polyquaternium-24; polyquaternium-37, cetrimonium chloride; Quaternium-24; mytrimonium chloride; PEG-2 cocomonium chloride; PEG-2  
20 cocoyl quaternium 4; PEG-15 cocoyl quaternium 4; PEG-2 stearyl quaternium 4; PEG-15 stearyl quaternium 4; PEG-2 oleyl quaternium 4; PEG-15 oleyl quaternium 4, and mixtures thereof, wherein the compound designation is provided by the Cosmetic, Toiletry and Fragrance Association, Inc. in the  
25 CTFA Cosmetic Ingredient Dictionary, 4th Ed., 1991, hereinafter referred to as the CTFA Dictionary. Other water-soluble quaternary ammonium compounds are listed in the CTFA Cosmetic Ingredient Handbook, 1st Ed., 1988 (hereinafter the CTFA Handbook) at page 40-42, incorporated  
30 herein by reference.

- 18 -

Other optional ingredients included in compositions of the invention may be paraffin, isoparaffin, beeswax, microcrystalline wax, ozokerite wax, carnauba wax, candelilla wax, vaseline solid paraffin, squalene, oligomer  
5 olefins and the like; amidoamines such as stearamidopropyl dimethylamine, isostearamidoethyl morpholine, behenamidopropyl dimethylamine and the like; humectants such as glycerine, propylene glycol, glycerol, sorbitol and the like; esters, such as isopropyl palmitate, isopropyl  
10 myristate, and stearyl stearate and the like; emulsifiers such as glyceryl monostearate, sorbitan monopalmitate, polyoxyethylene stearate and the like.

Optional holding polymers of the present invention include  
15 vinyl and acrylic-based resins such as Copolymer 845, 937 and 958, a vinyl pyrrolidone/dimethylaminoethyl methacrylate copolymer, Styleze CC-10, a PVP/DMAPA Acrylates Copolymer, Polymer 1189 (Terpolymer of Vinyl pyrrolidone/Vinyl Caprolactam and 3-(N-Dimethylaminopropyl) Methacrylamide,  
20 all of which are available from International Specialty Products; Gafquat polymers 734 and 755N designated as Quaternium-23, Gantrez ES-425 is the butyl ester of PVM/MA copolymer, all supplied by International Specialty Products, PVP K-30 to K-90, a polyvinylpyrrolidone of various  
25 molecular weights, obtained from BASF, Flexan 130, a Sodium Polystyrene Sulfonate, obtained from National Starch, Amphomer 28-4910, an Octylacrylamide/acrylates/butylamino methacrylate copolymer supplied by National Starch, Amphomer LV-71, Octylacrylamide/Acrylates/Butylaminoethyl Methacrylate  
30 Copolymer, Balance 0/55, a Methacrylate polymer, Versatyl-42, an Acrylates/Octylacrylamide Copolymer, Resyn 28-2930 is

- 19 -

VA/Crotonates/Vinyl Neodecanoate Copolymer and Lovocryl-47,  
an Octylacrylamide/Acrylates/Butylaminoethylmethacrylate  
Copolymer, Amaze Starch Polymer, all supplied by National  
Starch, Polyether Polyurethanes are available from Tyndale  
5 Plains Hunter, polyurethanes from IDPI, Luviset PUR  
polyurethanes from BASF, acrylates copolymers, acrylamide  
copolymers, acrylamide/sodium acrylate copolymer,  
acrylate/ammonium methacrylate copolymer, acrylate  
copolymers, acrylic/acrylate copolymers, acrylic esters and  
10 methacrylic esters copolymer, adipic  
acid/dimethylaminohydroxypropyl diethylenetriamine  
copolymer, adipic acid/ epoxypropyl diethylenetriamine  
copolymer, allyl stearate/VA copolymer, aminoethylacrylate  
phosphate/acrylate copolymer, ammonium acrylate copolymers,  
15 ammonium vinyl acetate/acrylate copolymers, AMP  
acrylate/diacetoneacrylamide copolymers, AMPD  
acrylate/diacetoneacrylamide copolymers, butylated PVP,  
butyl ester of ethylene/maleic anhydride copolymer, butyl

Optional saccharides which may optionally be used in the  
present invention include nonionic or cationic saccharides  
such as cellulose ethers including methyl cellulose,  
10 carboxymethyl cellulose, hydroxy propyl methyl cellulose,  
hydroxyethyl cellulose, hydroxypropyl cellulose, and ethyl  
hydroxyethyl cellulose, dextrans obtained from Sigma,  
Kitamer PC, a chitosan carboxylate and Kytamer L, a chitosan  
lactate obtained from Amerchol, Gafquat HS-100,  
15 Polyquaternium-28 from International Specialties,  
polyquaternium-4, polyquaternium-10, sodium alginate,  
agarose, amylopectins, amyloses, arabinans,  
arabinogalactans, arabinoxylans, carrageenans, gum arabic,  
cellulose derivatives such as methylcellulose,  
20 hydroxypropylmethylcellulose, hydroxyethyl cellulose,  
carboxymethylcellulose, carboxymethylguar gum,  
carboxymethyl(hydroxypropyl)guar gum, hydroxyethylguar gum,  
hydroxypropylguar gum, cationic guar gum, chondroitins,  
chitins, chitosans, cocodimonium hydroxypropyl oxyethyl  
25 cellulose, colominic acid [poly(N-acetyl-neuraminic acid)],  
corn starch, curdlan, dermatin sulfate, furcellarans,  
dextrans, cross-linked dextrans known as dextranomer  
(Debrisan), dextrin, emulsan, flaxseed saccharide (acidic),  
galactoglucomannans, galactomannans, glucomannans,  
30 glycogens, guar gum, or hydroxyethylstarch,  
hydroxypropylstarch, hydroxypropylated guar gums, gellan

- 22 -

gum, glucomannans, gellan, gum ghatti, gum karaya, gum tragacanth (tragacanthin), heparin, hyaluronic acid, inulin, keratan sulfate, konjac mannan, laminarans, laurdimonium hydroxypropyl oxyethyl cellulose, liposan, locust bean gum, mannans, nigeran, nonoxylnyl hydroxyethyl cellulose, okra gum, oxidized starch, pectic acids, pectins, polydextrose, potato starch, protopectins, psyllium seed gum, pullulan, sodium hyaluronate, steardimonium hydroxyethyl cellulose, raffinose, rhamsan, tapioca starch, welan, levan, scleroglucan, stachyose, succinoglycan, wheat starch, xanthan gum, xylans, xyloglucans, and mixtures thereof. Microbial saccharides can be found in the fourth edition of Kirk-Othmer Encyclopedia of Chemical Technology, Fourth Edition. Vol. 16, John Wiley and Sons, NY pp. 578-611, 1994 which is herein incorporated by reference. Complex carbohydrates can be found in the fourth edition of Kirk-Othmer Encyclopedia of Chemical Technology, Fourth Edition. Vol. 4, John Wiley and Sons, NY pp. 930-948, 1994 which is herein incorporated by reference.

Thickeners can be utilized alone or in combination so long as the chosen thickeners are compatible with the compositions of the invention (that is, that they cause the compositions of the invention to thicken). Thickeners can include, for example, Acrylic acid homopolymers under the Carbopol name from BF Goodrich, acrylates/C10-30 alkyl acrylate crosspolymer (Carbopol 1342, 1382, Pemulins TR-1 and TR-2 from BF Goodrich), Acrylates/Steareth-20 Itaconate Copolymer, Acrylates/Ceteth-20 Itaconate Copolymer, National Starch, Bentonite, PVM/MA Decadiene Crosspolymer from International Specialties Products, Acrylates/steareth-20

- 23 -

methacrylate copolymer, Acrysol ICS-1, Rohm and Haas Co.,  
acrylamide/sodium acrylate copolymer, Hostacerin PN 73,  
Hoechst AG., acrylate copolymer (Antil 208) supplied by  
Goldschmidt, acrylic acid/acrylonitrogens copolymer (Hypan  
5 SA-100H, SR-150H) supplied by Lipo, Acrylic/acrylate  
copolymer (Carboset 514, 515, 525, XL-19, XL-19X2, XL-28,  
XL-40, 526) supplied by BF Goodrich, Ammonium  
acrylates/acrylonitrogens copolymer (Hypan SS-201) from  
Lipo, Quaternium-18 Bentonite, Sodium salt of crosslinked  
10 poly(acrylic acid) under the tradenames PNC 430, PNC 410,  
PNC 400 from 3V, Stearalkonium Bentonite, Claytone, supplied  
by Southern Clay, Quaternium-18 Hectorite (Bentone 38),  
Stearalkonium Hectorite (Bentone 27) supplied by Rheox,  
acrylamide/sodium acrylate copolymer (Hostacerin PN 73)  
15 supplied by Hoechst, Poly(acrylic acid) known as Carbopol  
400 series (BF Goodrich) or Aquatreat (Alco 3V),  
polyquaternium-18 (Mirapol AZ-1) from Rhone Poulenc,  
polyquaternium-27, polyquaternium-31, polyquaternium-37,  
trihydroxystearin (Thixcin from Rheox; Flowtone from  
20 Southern Clay), Dimethylaminoethyl methacrylamide and  
acrylamide copolymer (Salcare SC63 from Ciba Specialties),  
Acrylic polymer anionic or cationic thickening agents  
(Synthalen CR and its related compounds) from 3V Sigma.

25 Other thickeners and polymers can be found in the "The  
Encyclopedia of Polymers and Thickeners for Cosmetics,"  
Cosmetics and Toiletries, Lochhead, R., pp. 95-138, Vol.  
108, (May 1993).

30 The compositions may also optionally contain a topically  
active agent selected from but not limited to para-

- 24 -

aminobenzoic acid (PABA); PABA esters, such as glyceryl PABA, amyldimethyl PABA and octyldimethyl PABA; cinnamates, such as octyl methoxycinnamate, ethylhexyl para-methoxycinnamate, 2-ethoxyethyl para-methoxycinnamate and  
5 cinoxate, benzophenones, such as benzophenone-4, oxybenzone and sulisobenzene, salicylates, such as octyl salicylate, anthranilates, such as methyl anthranilate; and mixtures thereof.

10

The topically active compound may also be an alpha hydroxy acid having the following structure:

wherein R can be hydrogen or an alkyl from 1 to 28 carbons.

20 Further optional components can include, for example: pH adjusting agents, viscosity and rheology modifiers, pearlescers, opacifiers, suspending agents, bacteriocides, coloring agents, fragrances, ultraviolet protective agents, dyes, proteins, herb and plant extracts, polyols, and other  
25 moisturizing and/or conditioning agents.

The topically active compound may also be a hair growth promoter such as glucarolactams, glucarolactones, and diacylglycerols, and mixtures, thereof.

30

Compositions of the invention can take the form of leave-in or rinse out conditioners. They can also be shampoos or

- 25 -

styling aids. Compositions of the invention can also be skin care products.

To use the rinse out compositions of the invention to  
5 condition hair, one first wets the hair, then applies the  
composition of the invention, next lathers the hair, and  
finally rinses the hair. Alternatively, water and  
conditioner may be applied to the hair simultaneously.  
Conditioning with compositions may be done right after  
10 shampooing when the hair is still wet. Alternatively,  
conditioning of the hair may be performed separately from  
shampooing on either wet or dry hair. Compositions of the  
invention may be leave-in conditioners as mentioned above.  
In such cases, the compositions of the invention are usually  
15 worked into the hair usually by using the fingers.  
Compositions of the invention may be used as shampoos by  
application to wet hair followed by lathering and rinsing.  
They may be used as styling aids in a conventional manner.  
They may also be used as skin care products in a  
20 conventional manner.

Compositions of the invention provide unexpectedly superior  
conditioner properties without the use of fatty alcohols.

25 Embodiments of the present invention will now be further  
illustrated by reference to the following examples and  
tables.

Compositions of the invention are made as follows:

- 30 1. The oil phase is mixed.  
2. The aqueous phase is added slowly to the oil phase.

- 26 -

ExamplesExamples of Wet Combing Force Data

5

Composition	A	B	C
	Weight percen t	Weight percen t	Weight percen t
Oil Phase			
DC 3225C	0	4.00	5.70
DC 5225C	3.00	0	0
DC200, 10cst	0.67	0	0
DC200, 5cst	1.33	0	0
DC 200, 1.5cst	2.00	6.50	6.90
DC200, 0.65cst	0	0	0
DC 245	3.40	0	0
Fragrance	0.30	0	0
Aqueous Phase			
Water	89.00	85.20	83.20
Salcare SC-96, 50%	1.00	0	0
Sodium Chloride	0	4.00	3.90
Preservative	0.30	0.30	0.30
Total			
Combing force (gm force)	8.7gm	36.2gm	35.9gm

\*Salcare SC-96 is polyquaternium-37/propylene glycol/dicaprylate dicaprates and PPG-1

- 10 Trideceth-6 available from Ciba Specialty Chemicals, Suffolk, Virginia.

15 Compositions A, B, and C above are all compositions of the invention. It is noted that the silicone surfactants DC 3225C AND DC 5225C are made up of a silicone surfactant and 80% of a volatile silicone such as D4 or D5.

- 27 -

#### Test 1 - Instron Wet Combing

Wet combing experiments were carried out utilizing an  
5 Instron 5500 Series. All testing was carried out by  
applying 0.3ml of product to bleached and waved 2g hair  
tresses. Results are expressed in terms of maximum load (gm  
of force).

10 Conventional Body conditioners have an average 13.1gm to  
about 40gm of force, whereas Example A has improved combing  
forces of about 8.7gm. Examples B and C have combing forces  
of about 36.2 and 35.9gm, respectively in order to impart  
greater body, volume and stylability to the hair. In other  
15 words, the increase in wet combing force caused by  
compositions of the invention is an advantageous property.  
Further examples demonstrate the versatility of the  
invention. Products that vary in softness, body and  
conditioning levels appear below. All examples may be left  
20 upon the hair or rinsed out. These products may also be  
utilized on the skin as well.

#### Salon Testing

25 The following Salon Blitz Testing table is a summary of the  
results from a salon test conducted. The benchmark for  
these studies was a moisturizing conditioner product sold in  
the North American market. These data indicated that  
Example C outperformed the benchmark formulation in its  
30 ability to deliver hair body as reported by the models.

#### Test 2 - Salon Blitz

- 28 -

Salon Blitz utilized female conditioner users as the panelists. A professional hair stylist applied the test product to half of the head and the benchmark product to the other side of the panelist's head. Once product has been applied, the stylist distributed the product evenly and left on the hair, keeping both sides separated. Product is then rinsed off after one minute. The panelists then dried and styled their own hair. A questionnaire was provided to each panelist asking them to rate (on a 9 point scale) hair characteristics for both the left and right side of the head. Higher values for key characteristics such as softness and fullness indicated a higher intensity for these attributes and therefore better performance on the hair. 20 panelists were recruited for each test product evaluation. Results for this test are shown in Table 1. The following Salon Blitz Testing table is a summary of the results from a salon test conducted. The benchmark for these studies was a moisturizing product sold in the North American market.

20

Table 1. Salon testing of Example C versus Benchmark Moisturizing Conditioner.

Attribute	Example C	Moisturizing benchmark-a commercial product	Difference
Overall Liking	6.83	6.42	+0.41
Body Added	7.05	6.11	+0.94
Conditioning	6.89	6.21	+0.68
Fullness	7.11	6.00	+1.11**
Bounce	7.16	5.95	+1.21**

- 29 -

Softness	7.42	6.63	+0.79
Amt. Conditioning	6.47	6.95	+0.68
Amt. Body	6.47	5.68	+0.79
Coating	3.53	4.47	-0.94
Amt. Bounce	6.84	5.37	+1.47**
Amt. Volume	6.21	5.00	+1.21**
Ease of Styling	7.42	6.74	+0.68
Static	2.16	3.16	-1.00**

\*A positive difference noted enhanced performance except in the case for static and coating where "Less static" and "Less coating" is desirable.

5

\*\*90% Confidence Level.

These data indicated that Example C outperformed the benchmark formulation in its ability to enhance hair body, bounce, volume and ease of styling without sacrificing softness as reported by the models.

- Permethyl 101A is a hydrocarbon available from Presperse, Inc., South Plainfield, New Jersey. DC-2-9040, 16% is a crosslinked polydimethylsiloxane available from Dow Corning, Midland, Michigan. IDPI polyurethane is a silicone polyurethane obtained from Alzo, Sayreville, New Jersey.
- 10 Examples D and E were designed to give greater softness to the hair. Examples F, G, H and I were designed to tame and control curly, thick or frizzy hair.

- 31 -

The following Salon Blitz Testing table is a summary of the results from a salon test conducted. The benchmark for these studies was a frizz taming product sold in the North American market. These data indicated that the HIPE formulation Example H outperformed the benchmark formulation in dispensing, application and in its ability to deliver hair body as reported by the models.

10 Test 3 - Salon Blitz

Salon Blitz utilized female frizz product users as the panelists. A professional hair stylist applied the test product to half of the head and the benchmark product to the other side of the panelist's head. Once product has been applied, the stylist distributed the product evenly and left on the hair, keeping both sides separated. The panelists then dried and styled their own hair. A questionnaire was provided to each panelist asking them to rate (on a 9 point scale) hair characteristics for both the left and right side of the head. Higher values for key characteristics such as softness and fullness indicated a higher intensity for these attributes and therefore better performance on the hair. Approximately 20 panelists were recruited for each test product evaluation. Results for this test are shown in Table 2.

- 32 -

Table 2. Salon testing of Example H versus a leading commercial frizz control product.

Attribute Intensity	Frizz Benchmark- commercial product	Example H
Ease of Dispensing	2.9	7.7*
Ease of Application	5.5	8.3*
Overall liking	6.3	6.6
Less frizzies	2.9	4.0
Softness	7.4	7.8
Fullness	6.6	7.1
Bounce	6.2	6.4
More Flat/Limp	3.6	3.0

5 \*90% Confidence Level.

Example A as a Leave-in Conditioner

Test 4 was similar to the salon application described in Test 2.

10

Table 3. Half-head Salon Testing versus Competitive Leave-in Conditioner.

Attribute Intensity	Leave-in Benchmark	Example A
Overall liking	Equal	Equal
Ease of wet combing	Control	Advantage
Manageability	Control	Advantage
Body	Control	Advantage

Example A presented distinct advantages in wet combing, manageability and body versus a competitive leave-in conditioner benchmark.

5

\*49% Dimethicone copolyol supplied by Dow Corning, Midland, Michigan.

- 36 -

Salon Testing

The following Salon Blitz Testing table is a summary of the results from a series of salon tests conducted. The  
5 benchmark for these studies is the best selling commercial extra body conditioner in the North American market. These data indicated that the HIPE formulation (Example P) outperformed the benchmark formulation in both overall conditioning and in its ability to deliver hair body as  
10 reported by the models.

Test 5 - Salon Blitz

Salon Blitz utilized female conditioner users as the  
15 panelists. A professional hair stylist applied the test product to half of the head and the benchmark product to the other side of the panelist's head. Once product has been applied, the stylist distributed the product evenly and rinsed it out taking care to keeping both sides separated.  
20 The panelists then dry and style their own hair. A questionnaire was provided to each panelist asking them to rate (on a 9 point scale) hair characteristics (e.g. conditioning and body) for both the left and right side of the head. Higher values for key characteristics such as  
25 conditioning or body indicates a higher intensity for these attributes and therefore better performance on the hair. 20 panelists were recruited for each test product evaluation. Results for this test are shown in Table 4.

Table 4. Salon testing of Extra Body Conditioner examples P versus benchmark conditioner.

Attribute	Example P	Benchmark -a commercial product	Difference
Overall Liking	6.47	5.63	+0.84
Wet Feel	6.37	5.58	+0.79
Wet Detangling	6.89	6.26	+0.63
Combing	6.26	6.26	0.00
Styling	5.78	6.00	-0.22
Coating	5.26	5.74	-0.48
Conditioning	5.37	5.00	+0.37
Softness	5.84	5.68	+0.16
Body	5.5	5.05	+0.45
Bounce	5.21	4.83	+0.38
Volume	5.32	4.89	+0.43

5 The above table shows that Example P delivered body without affecting conditioning performance. The results suggest that example P outperformed the benchmark conditioner in many areas. Without being held to this view, it is postulated that the enhanced overall liking, wet feel  
10 detangling, softness, body, bounce and volume may be attributed to the lack of fatty alcohol materials which may build up on the hair and weigh the hair down.

The above compositions may also be utilized as skin care  
15 products such as lotions, gels and shaving cream.

Examples of Skin Compositions

Composition	T	U	V	W	X	Y

In the above table compositions T and U are controls.

- 39 -

## Test 6 - Spreading, Greasiness and Residue Panel

The skin products were evaluated by rubbing 0.2g of product onto a watch glass and spreading the sample to create a smooth film. The spreading ease and greasiness was then ranked. A similar amount of material was also rubbed onto the skin and then ranked in order of fastest to slowest absorption (residue). The smooth afterfeel was also ranked.

It is noted that a lower number indicates more desirable performance aesthetics. Examples T and U were more tacky, sticky and undesirable on the skin when compared to Examples V and W. Examples V and W dried without a tacky transition phase. It was found that examples V and W also have the benefit of leaving behind very little residue and no greasy/oily afterfeel. In addition, examples T and U were more difficult to wash off the skin.

Table 5. Skin Cream Test Results.

Composition	Spreading Ease*	Greasiness	Residue	Smooth Afterfeel
T	4	4	4	4
U	3	3	3	3
V	2	2	2	2
W	1	1	1	1

\*A lower number for key characteristics indicates a lower intensity for these attributes and indicates better performance.

It should be understood that the present disclosure has been made only by way of preferred embodiment and that numerous

Claims

1. A composition which is selected from the group consisting of:

5

A.) a hair care composition which is a high internal phase water-in-oil emulsion which comprises:

(I) an oil phase which further comprises

10 i.) a mixture of non-volatile and volatile silicone oils, and

(II) ii.) a silicone surfactant; and

an aqueous phase; and which substantially lacks a fatty alcohol; and

15 B.) a skin care composition which is a high internal phase water-in-oil emulsion which comprises:

(I) an oil phase which further comprises i.) a mixture of non-volatile and volatile silicone oils, and ii.) a silicone surfactant; and

20 (II) which comprises an aqueous phase.

2. A composition according to claim 1 wherein the silicone surfactant is present from about 2% to about 15%.

25

3. A composition according to claim 1 wherein the non-volatile silicone is present from about 0.01% to about 10%.

30

- 42 -

4. A composition according to claim 1 wherein the volatile silicone component is present at about 0.01% to about 10%.

5 5. A composition according to claim 1 wherein aqueous phase is present from about 80% to about 95%.

6. A composition according to claim 1 further comprising an  
10 inorganic or organic salt in the aqueous phase.

7. A composition according to claim 1 further comprising an anionic, cationic or amphoteric or nonionic surfactant.  
15

8. A composition according to claim 1 further comprising a water soluble or oil soluble holding polymer.

20

9. A composition according to claim 1 further comprising a thickener.

25 10. A composition according to claim 2 wherein the silicone surfactant is a dimethylsiloxane of the formula:

30

|

PE

- 43 -

where PE=  $-\text{CH}_2\text{CH}_2\text{CH}_2\text{O}(\text{EO})_m(\text{PO})_n\text{Z}$ ,

wherein Me represents methyl, EO represents ethyleneoxy, PO represents 1,2-propyleneoxy, x and y are 1 or greater, m and n can be 0 or greater, however the molecular weight of the PE unit must be greater than 1000, and Z can be either hydrogen or a lower alkyl radical.

11. A composition according to claim 2 wherein the silicone surfactant is an alkyl dimethicone copolyol of the formula:

- 15 wherein p is a numeral from 7 through 17; q is a numeral from 1 through 100; m is a numeral from 1 through 40; n is a numeral from 0 through 200; and PE is  $(\text{C}_2\text{H}_4\text{O})_a(\text{C}_3\text{H}_6\text{O})_b\text{-H}$  having a molecular weight of about 250 to about 2000, wherein a and b are selected such that the weight ratio of
- 20  $\text{C}_2\text{H}_4\text{O}/\text{C}_3\text{H}_6\text{O}$  is from 100/0 to 20/80.

- 44 -

12. A composition according to claim 16 wherein the mixture of volatile silicone oils contains an oil in the range of about 1.4 to about 1.6cst and a silicone oil in the range of about 0.5 to about 0.7cst.

5

13. A composition according to claim 17 wherein one volatile silicone oil has a viscosity of about 0.5cst and the other volatile silicone oil has a viscosity of about  
10 1.5cst.

14. A composition according to claim 6, wherein the salt is an inorganic or organic salt wherein the salt is sodium  
15 chloride, potassium chloride, sodium citrate, sodium lactate, aluminum zirconium glycinate, aluminum chlorohydrate, salts of amino acids, or mixtures thereof.

20 15. A composition according to claim 7, wherein the anionic surfactant is selected from the group consisting of alkyl sulphates, alkyl aryl sulphonates, alkyl ether sulphonates, alkyl ether sulfates, alkyl sulfonates, alkyl isothionates, alkyl succinates, alkyl sulphosuccinates,  
25 alkyl sarcosinates, alkyl phosphates, alkyl carboxylates, alkyl ether carboxylates and alpha-olefin sulphonates; and their sodium, magnesium, ammonium, and mono-, di-, and tri-ethanolamine salts, and mixtures thereof.

30

- 45 -

16. A composition according to claim 7, wherein the cationic surfactant has the structure:

wherein  $R_1$  is an alkyl group including from about 8 to about 20 carbon atoms;  $R_2$  is selected from the group consisting of an alkyl group including from about 8 to about 20 carbon atoms, a hydrogen atom, a methyl group, an ethyl group, a hydroxymethyl group and a hydroxyethyl group;  $R_3$  is selected from the group consisting of a benzyl group, a hydrogen group, a methyl group, an ethyl group, a hydroxymethyl group and a hydroxyethyl group;  $R_4$  is selected from the group consisting of a hydrogen atom, a methyl group, an ethyl group, a hydroxymethyl group and a hydroxyethyl group; and  $x$  is an anion selected from the group consisting of chloride, methosulfate, ethosulfate, nitrate, bromide, tosylate, acetate, or phosphate, and mixtures thereof.

15

20

- 46 -

17. A composition according to claim 23, wherein the cationic surfactant has the structure:

5

10

and the quaternary nitrogen and two of  $R_1$ ,  $R_2$ ,  $R_3$ , and  $R_4$ , form a heterocyclic nitrogen-containing moiety, selected from the group consisting of morpholine and pyridine.

15

18. A hair product comprising the composition of claim 1 in a form selected from the group consisting of shampoo, conditioner, spray, mousse, gel, foam, styling conditioner, hair serum, lotion, crème, treatment product or pommade.

19. A skin product comprising the composition of claim 1 in a form selected from the group consisting of gel, body wash, lotion, or cream.

20. A method of treating the hair or skin with a composition according to claim 1.

Further documents are listed in the continuation of box C.

Patent family members are listed in annex.

\* Special categories of cited documents:

\*A\* document defining the general state of the art which is not considered to be of particular relevance

\*E\* earlier document but published on or after the international filing date

\*L\* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

\*O\* document referring to an oral disclosure, use, exhibition or other means

\*P\* document published prior to the international filing date but later than the priority date claimed

\*T\* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

\*X\* document of particular relevance: the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

\*Y\* document of particular relevance: the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

\*Z\* document member of the same patent family
